WIND-TUNNEL INVESTIGATION OF MUTUAL INTERFERENCE LOADS

ON A SUPERSONIC BOMBER CONFIGURATION AND STORE

DURING SEPARATION AT MACH NUMBERS

OF 1.57, 1.77, AND 2.01

COORD. NO. AF-AM-91

By Owen G. Morris and Kenneth L. Turner

SUMMARY

An investigation has been conducted in the Langley Unitary Plan wind tunnel to determine the mutual interference loads on a supersonic bomber configuration and store during separation of the store. The complete airplane model and the store model with and without fins were tested with the store at 43 positions varying in longitudinal and vertical distance relative to the airplane at Mach numbers of 1.57, 1.77, and 2.01. Tests were made for airplane angles of attack from -1.0° to 5° and store angles of attack from -10° to 12° at zero sideslip, and at airplane sideslip angles of 2° and -2° for store sideslip angles of 4° and 0°, respectively. The Reynolds numbers for the tests, based on wing mean aerodynamic chord, are 1.98×10^6, 1.85×10^6, and 1.68×10^6 at Mach numbers of 1.57, 1.77, and 2.01, respectively.

I.N. 11,325

INTRODUCTION

The determination of the path followed by a store released from an aircraft in flight is required to determine: (a) that a safe separation of the store from the aircraft is possible, (b) that the accelerations experienced during the separation are within the design load limits, (c) the impact point.

The problem of determining the path requires a knowledge of the aerodynamic loads on the aircraft and store as the store traverses the interference field produced by the aircraft. It is not possible to determine the interference loads by existing theoretical methods. In order to supply such information for an airplane currently nearing production, the mutual interference loads between a supersonic bomber configuration and a store during separation of the store have been experimentally determined at the Langley Unitary Plan wind tunnel.

The aerodynamic forces and moments were measured separately for the complete airplane model and for the store model, with and without fins. The store model was tested at 43 different positions under the airplane model in the plane of symmetry of the airplane. At each position of the store, the store and the airplane were independently moved through a range of angle of attack at three angles of yaw.

The results are presented in tabular form without analysis or discussion.

SYMBOLS

The aerodynamic moments on the airplane and store have been referred to stability axes. The airplane center of gravity (moment center) is located at 0.25 mean aerodynamic chord and at 0.10 inch above the zero water line. The store center of gravity is located on the store center line 6.667 inches behind the nose. Symbols used in this paper are as follows:

$C_D{}'$ approximate drag coefficient, $\dfrac{F_{D,R}{}'}{qS}$ or $\dfrac{F_{D,P}{}'}{qA}$

C_L lift coefficient, $\dfrac{F_{L,R}}{qS}$ or $\dfrac{F_{L,P}}{qA}$

C_l rolling-moment coefficient, $\dfrac{M_{X,R}}{qSb}$ or $\dfrac{M_{X,P}}{qAd}$

C_m pitching-moment coefficient, $\dfrac{M_{Y,R}}{qS\bar{c}}$ or $\dfrac{M_{Y,P}}{qAd}$

C_n yawing-moment coefficient, $\dfrac{M_{Z,R}}{qSb}$ or $\dfrac{M_{Z,P}}{qAd}$

C_Y side-force coefficient, $\dfrac{F_{Y,R}}{qS}$ or $\dfrac{F_{Y,P}}{qA}$

$F_D{}'$ force along X-axis, lb

F_L force along Z-axis, lb

F_Y force along Y-axis, lb

M_X moment about X-axis, in-lb

M_Y moment about Y-axis, in-lb

M_Z moment about Z-axis, in-lb

S   wing area, 0.963 sq ft

A   cross-sectional area of store, 0.0122 sq ft

b   wing span, 17.058 in.

$\bar{c}$ wing mean aerodynamic chord of airplane, 10.85 in.

d   maximum store diameter, 1.500 in.

q   dynamic pressure, lb/sq ft

x_a horizontal distance parallel to X-axis measured from attached store position, in.

z_a vertical distance parallel to Z-axis measured from attached store position, in.

α angle of attack, deg

$\Delta\alpha$ flow angularity correction, deg

β angle of sideslip, deg

Subscripts:

R   return component (airplane model)

P   bomb pod (store model)

APPARATUS AND METHODS

Tunnel

The tests were conducted in the low Mach number test section of the Langley Unitary Plan wind tunnel, which is a variable-pressure, return-flow type. The test section is 4 feet square and approximately 7 feet in length. The nozzle leading to the test section is of the asymmetric sliding-block type, which permits a continuous variation of Mach number from approximately 1.56 to 2.80.

Models and Support System

The airplane model configuration, also called the return component, consisted of a 60° conical-cambered delta wing, an indented fuselage, four pylon-mounted engine nacelles, and a vertical tail (fig. 1). The store configuration, also called the bomb pod, is shown in figure 2 and it consisted of a body of revolution with a fineness ratio of 10.15 to which was added a mounting pylon and four stabilizing fins. The geometric characteristics of the models are presented in table I and photographs of the models are presented in figure 3.

The airplane and store were attached to individual internally mounted six-component strain-gage balances which in turn were attached to individual stings mounted on a special support mechanism. The support mechanism allowed both the airplane and store models to be independently positioned at various predetermined horizontal distances x_a, vertical distances z_a, and angles of attack α (fig. 4).

During the sideslip tests, the store model was rotated about its center of gravity to give the store a positive 2° angle of sideslip increment with respect to the airplane model. The sideslip tests were then conducted by yawing the entire support mechanism.

TESTS

The tests were conducted with the complete airplane model and the store model both with and without fins. Tests were made through an angle-of-attack range of -1° to 5° for the airplane model and -10° to 12° for the store model. Tests were made with both models at 0° sideslip and also with the store model given a 2° sideslip increment with respect to the airplane. The airplane model was tested at 2° and -2° sideslip, which resulted in sideslip of the store of 4° and 0°, respectively.

At any given angle of attack of the airplane model, the store model was tested at various separation distances (x_a and z_a, as shown in fig. 4) and at several angles of attack.

The tests were conducted at Mach numbers of 1.57, 1.77, and 2.01 with Reynolds numbers based on the airplane model mean aerodynamic chord of 1.98×10^6, 1.85×10^6, and 1.68×10^6, respectively. For all tests, the stagnation pressure was 8 pounds per square inch absolute, the stagnation temperature was 125° F, and the dewpoint was less than -30° F.

For all tests, the elevons of the airplane model were set with the trailing edge up 3° relative to the wing chord line.

CORRECTIONS AND ACCURACY

All angles of attack, angles of sideslip, and separation distances have been corrected for deflection of the sting due to aerodynamic loads. The lateral displacements of the models due to sting deflection during sideslip tests were computed but in all cases were found to be less than 0.05 inch.

For all tests, the nacelles of the airplane model were open to air flow. Neither the internal flow losses nor the nacelle base pressures were measured, however, and no corrections have been made for their effects. The balance-chamber pressures were measured for both the airplane and store models, and the drag data for each were corrected to correspond to a balance-chamber pressure equal to free-stream pressure.

Pressure gradients in the test section region occupied by the model have been determined and are sufficiently small to make buoyancy effects negligible. The maximum deviation of local Mach number in the portion of the tunnel occupied by the model was ± 0.015 from the average values presented in the data. Although the test section has not been completely calibrated as yet, preliminary tests indicate that a small flow angularity in a vertical plane is present in the test section. Based on these preliminary tests, the following corrections have been applied to the measured angles of attack of both the airplane and store models at the indicated Mach numbers:

M	$\Delta\alpha$, deg
1.57	0.20
1.77	.40
2.01	.75

Based on pretest calibration and reproducibility, the accuracy of the force and moment coefficients, distances presented, and relative angles are estimated to be within the following limits:

$C_{L,R}$ . . . . ±0.002

$C_{D,R}'$ . . . . ±0.0005

$C_{m,R}$ . . . . ±0.0005

$C_{l,R}$ . . . . ±0.0001

$C_{n,R}$ . . . . ±0.0001

$C_{Y,R}$ . . . . ±0.001

$C_{L,P}$ . . . . ±0.04

$C_{D,P}'$ . . . . ±0.01

$C_{m,P}$ . . . . ±0.08

$C_{l,P}$ . . . . ±0.03

$C_{n,P}$ . . . . ±0.04

$C_{Y,P}$ . . . . ±0.02

α_R, deg . . . . ±0.1

α_P, deg . . . . ±0.1

β_R, deg . . . . ±0.1

β_P, deg . . . . ±0.1

x_a, in. . . . . ±0.1

z_a, in. . . . . ±0.1

PRESENTATION OF RESULTS

The results are presented as tabulated coefficients of forces and moments referred to the stability axes system in tables II to VII. The aerodynamic moments on the airplane and store are taken about their respective centers of gravity as shown in figures 1(a) and 2. The following list is presented to facilitate use of the tables:

Table I - Geometric characteristics of the models

Table II - Aerodynamic characteristics of return component and bomb pod
with mutual interference: $\beta_P = 0°$; $\beta_R = 0°$

Table III - Aerodynamic characteristics of return component and bomb pod
less fins with mutual interference; $\beta_P = 0°$; $\beta_R = 0°$

Table IV - Aerodynamic characteristics of return component in presence
of bomb pod; $\beta_P = 4^O$; $\beta_R = 2^O$

Table V - Aerodynamic characteristics of bomb pod in presence of return
component; $\beta_P = 4^O$; $\beta_R = 2^O$

Table VI - Aerodynamic characteristics of return component in presence
of bomb pod; $\beta_P = 0^O$; $\beta_R = -2^O$

Table VII - Aerodynamic characteristics of bomb pod in presence of return
component; $\beta_P = 0^O$; $\beta_R = -2^O$

Figure 5 shows representative schlieren photographs taken during
the investigation.

WIND-TUNNEL INVESTIGATION OF MUTUAL INTERFERENCE LOADS

ON A SUPERSONIC BOMBER CONFIGURATION AND STORE

DURING SEPARATION AT MACH NUMBERS

OF 1.57, 1.77, AND 2.01

COORD. NO. AF-AM-91

By Owen G. Morris and Kenneth L. Turner

ABSTRACT

Presented are data on mutual interference loads of a supersonic bomber configuration and store during separation of the store. The bomber configuration had a delta wing with $60°$ sweepback of the leading edge, aspect ratio of 2.096, taper ratio of 0, and a dihedral of $2.23°$. The data are presented in tabular form without discussion or analysis.
